A LITTLE SPACE FOR BIG STORIES

A home for stories. *Built to be explored.*

Shelf Notes is a small library catalog for keeping track of the books you love, the ones you lend, and the ones ready for their next reader. A calm, book-inspired interface meets a practical API behind the shelves.

A CATALOG MADE FOR EVERYDAY READING

01

Find your next read

Browse the collection, search by title or author, and filter by genre.

02

Keep the shelves current

Add books, edit their details, remove entries, and track availability.

03

One clear catalog API

A .NET API serves the catalog and its create, read, update, and delete actions.

HOW THE PIECES FIT

From a book card to the catalog

The React interface sends JSON requests through Vite's local API proxy. ASP.NET Core minimal API routes validate the request, call the catalog service, and return a clear HTTP response for the page to display.

React UI → REST endpoints → Catalog service

WHAT A BOOK RECORD HOLDS

Useful details, at a glance

Title, author, genre, publication year, description, and availability power the shelf cards, search and genre filters, and the add and edit forms.

TITLE · AUTHOR · GENRE · YEAR · DESCRIPTION · AVAILABILITY

A SMALL, PRACTICAL REST API

FIVE ROUTES · ONE RESOURCE

GET	/api/books	List the collection
GET	/api/books/{id}	Find a single book
POST	/api/books	Add a book · returns 201 Created
PUT	/api/books/{id}	Update a book
DELETE	/api/books/{id}	Remove a book · returns 204 No Content

WHAT THIS PROJECT DEMONSTRATES

Core full-stack building blocks

- Separating a frontend from a backend API
- Validating input and showing helpful UI feedback
- Exploring endpoints through an OpenAPI document
- Mapping CRUD actions to HTTP methods and status codes
- Keeping catalog logic behind a service interface

UNDER THE COVER — REACT · VITE · ASP.NET CORE · REST API

Demo data is held in memory and resets when the API restarts. Persistent storage can be added next.
